alt Documentation Status

Spinnaker is an open source, multi-cloud Continuous Delivery and Deployment platform that provides a single pane of glass with visibility across your deployment for deployment status, infrastructure, security and compliance, and metrics. By using pipelines, flexible and customizable series of deployment stages, Spinnaker can fit a variety of deployment needs.

Spinnaker can deploy to and manage clusters across Amazon Web Services (AWS), Kubernetes, and Google Cloud Platform (GCP). More functionality is being added all the time. For example, work is being done to improve integrations with all cloud the providers, including Cloud Foundry and Microsoft Azure.
